

EXTRACTION FROM MULTIPLE SOURCES

If there are 3 or more grinding or polishing stations, installing a central dust extraction system becomes a more efficient and practical solution. Bomaksan engineers and solution partners are ready to support you in designing the right dust collection system with optimal performance and energy-efficient operation.

CENTRAL EXTRACTION FILTERS

Bomaksan offers a wide range of central dust extraction systems for grinding and polishing applications—from compact plug-and-play units to modular cartridge filter systems. Our product portfolio includes horizontal round cartridges, vertical round cartridges, and pleated flat panel filters, each offering unique advantages depending on the project requirements.

Designing an efficient jet-pulse dust collector for grinding and polishing isn't simple. Key parameters such as filtration and can velocity, valve sizing and angles, and header tank design must all be carefully calculated. With over 35 years of experience, Bomaksan delivers high-performance jet-pulse cartridge filters tailored for superior dust control in surface finishing processes.
