

LEV SOLUTIONS

LEV refers to a system used to control and capture airborne contaminants, such as dust, fumes, vapors and gases at their source before they can disperse into the general work environment.

LOCAL EXHAUST VENTILATION

This system combines components such as hoods, ducts, fans, and filters, specifically designed to capture and remove dust generated during grinding and polishing operations.

The main goal of a Local Exhaust Ventilation (LEV) system is to protect worker health by reducing exposure to hazardous airborne particles. By capturing contaminants directly at the source, LEV systems ensure a safer, cleaner working environment and support compliance with occupational health and safety regulations.
